The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase activity in cells in vivo is useful in prophlactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative diseases. Inhibition of telomerase in haematopoietic stem cells is useful for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human the method of the immune system. The present sequence represents human the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

New polynucleotide useful for inhibiting telomerase activity in cells, for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ŗ

The sequence represents an antisense oligonucleotide used in the purification of human telomerase. The invention relates to a purified human telomerase. The invention relates to a purified human telomerase core enzyme protein comprising 2000-fold increased than a crude extract of cells from adenovirus-transformed purity compared with a crude activity and a molecular weight of 200-2000 kidney cell line (293 cells) and when associated with telomerase RNA component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (KDa). The purified telomerase is useful for inducing a humoral or cell-mediated immune response in an animal. Purified telomerase or immunogenic fragments are useful as vaccines for treating diseases associated with over-expression of telomerase, such as cancer as affinity agents in insolating the proteins and for detecting the proteins are sell or tissue. Identification of telomerase aids in diagnosis of cancer or pre-cancerous states.

Telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase-association or EF2H with telomerase

the purification of human telomerase. The invention relates to a purified human telomerase core enzyme protein comprising 2000-fold increased purity compared with a crude extract of cells from ademovinus-transformed kidney cell line (293 cells) and when associated with telomerase RNA component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (KDa). The purified telomerase is useful for inducing a humoral or cell-mediated immune response in an animal. Purified telomerase or immunogenic fragments are useful as vaccines for treating telomerase associated with over-expression of telomerase, which are useful as affinity agents in isolating the proteins and for detecting the presence of proteins in a sample, such as cell or tissue. Identification of telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase associated proteins, such as nucleolin or EF2H with telomerase
                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a method for inhibiting or reducing the growth of a cell which involves administering to the cell a telomere damage inducing agent and a telomerase inhibitory agent. This can be used in the treatment of aberrant cell growth, including cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 growth of cell for treating cancer, comprising damage-inducing agent and telomerase inhibitory

this represents an antisense oligonuclectide to the RNA component of human telomerase (hTR). The invention relates to an activator-antisense complex that comprises: (a) an antisense oligonuclectide, complementary to a 12-25 nuclectide portion of hTR, with a hydroxyl moiety at the first to a 12-25 nuclectide portion of hTR, with a hydroxyl moiety at the first card; and (b) a linker attached to the first end, and (c) an activator of RMsse L attached to the linker. The activator-antisense complex may be used for inhibiting the growth of a telomerase-expressing malignant cells or tumour. The complex is used to specifically cleave the ribonuclectide or tumour, renal cell cancer, mean and prostate cancer. Many other tumour, renal cell cancer, mean and prostate cancer. Many other canting and related disorders, may be treated including various acute and chronic leukemias, polychemia vera, Hodgkin's and non-Hodgkin's lymphomas, multiple myeloma, Waldenstrom's macroglobulinemia, Hodgkin's lymphomas and selate myeloma, waldenstrom's macroglobulinemia, carcinomas. The complex is preferably administered in combination with a chemotherapeutic agent, particularly either displatin, doxornation with a chemotherapeutic agent, particularly either displatin, doxornation with

```
Sequences shown in AAV41169 to AAV41181 represent antisense
oligonucleotides to the RNA component of human telomerase (hTR). These
antisense oligonucleotides specifically hybridise to a nucleotide
sequence within an accessible region of the hTR, but that does not
hybridise to a sequence within the template region of hTR. These
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitory
oligonucleotides can inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the half-
life of the telomerase RNA component transcript, inhibiting the
polymerase activity of telomerase holeenzyme, or inhibiting the
polymerase activity of telomerase activity in both cultured cells and in
cells in vivo. They can be used in therapeutics for treating or
munosuppression, and for selectively down-regulating specific branches
immunosuppression, and for selectively down-regulating specific branches
of the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection.

The present sequence represents a telomerase target sequence. The invention relates to an antisense oligonuclectide used as a control sequence alongside a peptide nucleic acid molecule which hybridises to the mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an il nucleotide contained within the RNA component of the enzyme. The invention contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of row more than 25 bases, which include the sequence GTTARGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, conficience of association with targeted nucleic acids, and the increases the rate of association with targeted nucleic acids, and concrets, neoplasia, hyperplasia, neurodegenerative diseases or nucleases. The charapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other cytocoxic circ diseases characterized by abnormal telomerase activity, in combination with antineoplastic and other cytocoxic cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization cytoscatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization of individuals, e.g. paternity testing, based on hTR gene restriction for probes to detect the RNA component of a mammalian telomerase and as probes to detect the RNA component of a mammalian telomerase and allows cancerous conditions to be detected with increased confidence and New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the inhibitor, neoplasia, neurodegenerative disease, aging, hyperplasia, AIDS, HIV, fungal infection, forensic identification, detect, tumour, paternity testing; ss. The present sequence represents an antisense polyamide nucleic acid (PNA)), which is covalently linked to a RNase Lactivator moiety. The oligonuclectide is used in the method of the activator moiety. The oligonuclectide is used in the method of the invention. The specification describes a method of cleaving a specific RNA, optionally contained within a cell. The method comprises hybridising the RNA with a chimeric molecule of antisense PNA and RNAse L activator molecule is useful for treating Respiratory Syncytial Virus infection, inhibiting tumour growth, treating viral infection (e.g. human immunodeficiency virus (HIV)), autosomal dominant diseases caused by a mutant gene, chronic myelogenous leukemias, and Crohns disease and other inflammatory conditions. It is also useful for sequence-specific inhibition of a targeted mRNA in order to effectively knock out the associated gene as an aid to elucidating the function of the encoded

The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in nammalian cells by Mybridising to the RNA component of mammalian cells by Mybridising to the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (HTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the MTR gene RFLP pattern. The PNAs can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases, and combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, hyman immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase to activity. The present sequence repersenting hTR RNA strand #3 is used to test the inhibition of telomerase activity by the PNAs of the present
                                                                                                                                                                                                                                                                Mammalian; forensic; paternity testing; human telomerase RNA component; hTR gene RFLP pattern; cancer; inflammation; lymphoproliferative disease; autoimmune disease; neurodegenerative disease; neoplasia; hyperplasia; HIV; AlDS; human immunodeficiency virus; telomere metabolism; cytostatic; acquired immunodeficiency syndrome; anti-inflammatory; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptide nucleic acids that hybridizes to the RNA component of mammalian telomerase, useful for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA characteries. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprises esnes and antisense of single stranded. They further comprises sense and antisense of single stranded. They further comprises enses and antisense of single stranded. They further comprises and antisense of single stranded. The single sinclude short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA; and vectors that express sink. The siNAs are used to modulate expression of the telomerase genes in calls, tissue candour complexes of siNA; and vectors there express sink. The siNAs are used to modulate expression of the telomerase genes in calls, tissue captaints for the treatment of a variety of conditions. They may be used for treatming cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases. Ce sy multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying sene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded sink, which is identical to the c-fos transcript target sequence.

The siNAs may or more to comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short haipin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and
                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthitic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; sinA; short interfering RNA; albNA; double-stranded RNA; micro-RNA; miRNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

ö
   used for treating cancer, restenois, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siMas are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene represents the upper strand of a human TERC-targeted double-stranded sIMA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense
                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human TERC transcript target sequence/siNA upper strand, SEQ ID 29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                  .

cc regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short in the faring RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Serpressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, c.g. multiple sclerosis, lupus erythmatosus, AlDS, macular degeneration, stin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence was which is adaptically the content of a human TERC targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA connergulate expression of the one or more telomerase genes by RNA connergulate expression of mean telementatively are assembled from a sense oligonucleotide and an interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, and/or camplexes of siNA; and vectors that express in calls, tissue contained to modulate expression of the telomerase genes in calls, tissue capplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, skin ulcers and rheumatoid arthritis. The sinas are also useful for drug screening, diagnosis, lupus erythematosus, ALDS, macular degeneration, skin ulcers and rheumatoid arthritis. The sinas are also useful for drug careening, diagnosis, lupus erythematosus, ALDS, macular degeneration, capping (e.g., of single nucleotide polymorphisms). The present sequence construction, and gene construction, and gene construction, and gene construction, and gene construction and such construction 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                    New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The invention relates to short interfering nucleic acids (sinA) which downregulate expression of the one or more telomerase genes by RNA interference. The sinNa may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antiense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the sinNa include short hairpin RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised. Cexpressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be

New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.

The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, suddying gene function, and gene mapping (e.g., of single nuclecide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; double-stranded RNA; micro-RNA; miRNA; double-stranded RNA; micro-RNA; miRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

  q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                   The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an intisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short harpin RNA (shRNA). The siNAs can be unmodified or chemically modified, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and vector or express sion of the telomerase genes in cells, tissue used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and treatment of a variety of conditions. They may be used for treating cancer, restenoisis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, c. g. multiple sclerosis, lubus erythematosus, ADDS, macular degeneration, contening, diagnosis, therappeutic target identification and validation, or surface the sinks are also useful for drug screening, diagnosis, therappeutic target identification and validation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              genetic engineering, pharmacogenomics, studying gene function, and gene
mapping (e.g., of single nucleotide polymorphisms). The present sequence
represents the upper strand of a human TERC-targeted double-stranded
siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human TERC transcript target sequence/siNA upper strand, SEQ ID 16.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA communications and antisense of interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense coligonacleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically synthesised, can contain deoxyribonucleotides, and can be enemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complaces of siNA; and vectors that express siNAs are cused to modulate expression of the telomerase genes in cells, tissue capiants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically, protozoal), transplant rejection, or autoimmune or age-related diseases, ce.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug correcting, dharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence cepture, expressents the upper strand of a human TERC-targeted double-stranded crepresents the upper strand of a transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and matisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short natisense oligonuclectide. Specifically, the siNAs include short hairpin RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised, captace to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and cransplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration skin ulcers and rheumatoid arthritis. The sINAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer. siNA, which is identical to the c-fos transcript target sequence. Example 3; SEQ ID NO 17; 145pp; English.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antiense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short hairpin RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. Service or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express sine. The siNAs are used to modulate expression of the telomerase genes in cells, tissue candout the treatment of a variety of conditions. They may be transplants for the treatment of a variety of conditions. They may be used to modulate concerned the sine of the telomerase genes in cells. They may be used to modulate concerned the sine of the conditions diseases (specifically concerned the sine of the telomerase genes in cells. They may be used to modulate concerned the sine of the sine of the telomerase seases (specifically concerned the sine of the sine of the telomerase seases (specifically concerned the sine of sine of the sine of sine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genee by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense aradions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short
e.g. multiple sclerosis, lupus erythemarobus, hard, margine useful for drug skin ulcers and rheumatoid arthritis. The siMas are also useful for drug screening, diagnosis, therapeutic taget identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TBRC-targeted double-stranded siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiartitic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering NNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hinterfering syresion modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

ean contain decoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vivo of elivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explaints or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, ALDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; anti-HIV; ophthalmological; elomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
hairpin RNA (shRNA). The sinAs can be unmodified or chemically modified,

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cyplants for the treatment of a variety of conditions. They may be used for treathing cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence mapping (e.g., of single nucleotide polymorphisms). The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; snot interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised. Can contain deoxyribonuclectides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA: conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tesque cused transplants for the treatment of a variety of conditions. They may be used for transplants for the treatment of a variety of conditions. They may be used for transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug correining, diagnosis, therapelutic target identification and and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence correspond to a human TRRC-targeted double-stranded diseases correspond to a human transporter that part and correspond to a human transporter to the present engagement of a human transferior that presents the upper strand of a human transferior that present strand of a human transferior that presents the upper strand of a human transferior that presents the upper strand of a human transferior that proverser and the upper strand of a human transferior the present engineering the present the proverser and the up
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; slNA; short interfering RNA; double-stranded RNA; micro-RNA; miRNA; short interfering sha, shrNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an trisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyriboucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and vectors that express sinA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically contains) transplant rejection, or autoimmune or age-related diseases, e.g. e.g. multiple sclerosis, lupus erythematosus, ADS, mecular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA;

The invention relates to short interfering nucleic acids (siNA) which commission of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense cregions, or alternatively are assembled from a sense oligonuclectide and antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised, can complexes of siNA; and vectors that express in Rni invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the traatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically process), intenting are selected, in the sinas are also useful for drug screening, diagnosis, lupus erythematosus, AIDS, macular degeneration, egenetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence mapping (e.g., of single nucleotide polymorphisms). The present sequence the single of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNas may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense colligonacleotide. Specifically, the siNas include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNas can be unmodified or chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, captessed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express sinA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and cransplants for the treatment of a variety of conditions. They may be used for treatming cancer, restenosis, induse explantence or age-related diseases, conditions and rheumatoid arthritis. The siNAs are also useful for drug stin ulcers and rheumatoid arthritis. The siNAs are also useful for drug serienning, diagnosis, therapeuter target identification and validation, serening, diagnosis, therapeute, expending gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-target educate.

The invention relates to short interfering nucleic acids (sINA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue candor complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases.

Scorp multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation,

                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also
                                                                                                                                                                                                                                                                                                                  Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthitic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; mixNA; short hit sypression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TBRC-targeted double-stranded

ö
relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lugus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleoide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthitic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; mikNA; short halipin RNA; shraw; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

CC The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA controlled and antisense obtained stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can expressed from a vector or enzymatically synthesised. The invention also crelates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express sincells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protocoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The sinAs are also useful for drug screening, disagnosis, lupus erythematosus, AIDS, macular degeneration, can empining (e.g., of single nucleotide polymorphisms). The present sequence mapping (e.g., of single nucleotide polymorphisms). The present sequence contains the sinal sector of a human tracet organisms of the paper strand of a human tracet organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; dhort halfpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antiense regions, or alternatively are assembled from a sense oligonuclectide and an artisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised.

C expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthitis. The siMs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; asiRNA; double-stranded RNA; micro-RNA; miRNA; short hinterfering syrpession modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

                                                                                                                                                                                                                                                                                                                                                         The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense cregions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include and short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, and or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically proteozal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AlDS, macular degeneration, sorcening, diagnosis, therapeutch target identification and validation, and contain and contains an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised. Sequence of kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue transplants for the treatment of a variety of conditions. They may be transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infections diseases (specifically cused for treating cancer, restenosis, infections diseases (specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclenosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense credions, or alternatively are assembled from a sense onigonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically synthesised, can contain a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express sinha. The siNAs are used to modulate expression of the tellomerase genes in cells, tissue caphants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene companies the lower strand of a human TERC-targeted double-stranded Example 3; SEQ ID NO 282; 145pp; English.

New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.

3xample 3; SEQ ID NO 283; 145pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense could be comprised and antisense could be stranded. They further comprise sense and antisense could be stranded. They further comprise sense and antisense contains and sold contains a sense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Or relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are captains or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be transplants for the treatment of a variety of conditions. They may be conditions and rheumatoid arthritis. The siNAs are also useful for drug screening, disagnosis, luque srythematosus, AIDS, macular degeneration, genetic engineering, pharmacogenomics, studying gene function, and gene companying (e.g., of shalle mucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded

explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple solerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                      Score 19; DB 1; Length 19;

The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, expressed from a vector or enzymatically synthesised, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue

be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sings include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short harpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically mythesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and vector or express sed. The invention also relates to kits for the invitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express since siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and tended for treating cancer, restencesis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, ce.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, ergineering, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded sink, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA convergulate expression of the one or more telomerase genes by RNA convergence. The siNAs may or may not comprise sense and antisense of interference. The siNAs may or may not comprise sense and antisense of ingoniclectide. Specifically, the siNAs inclored short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNAs can be unmodified or chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised or chemically southesised conformally conjugates and/or complaxes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue captants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically strended diseases).

Control of a multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The sinAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, serion ceptoses the upper strand of a human TRRC-targeted double-stranded capture represents the upper strand of a human TRRC-targeted double-stranded cupier supper strand of a human TRRC-targeted double-stranded cupier sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hinterfering; therapput of terger identification; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include abort interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and cransplants for the treatment of a variety of conditions. They may be used for treating cancer restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, c.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded sinAA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antinheumatic; antiarthitic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression medulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                           New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siNAs), double-stranded RNA, micro-RNA (mirRNA) and short can contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, and/or complexes of siNA; and vectors that express in relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treatsplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single mucleotide polymorphisms). The present sequence contains and part with a substance of the single mucleotide polymorphisms). The present sequence the single mucleotide polymorphisms). The present sequence the single mucleotide polymorphisms).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.

The invention relates to short interfering nucleic acids (sinA) which downrequiate expression of the one or more telomerase genes by RNA interference. The sinAs may or may not comprise ribonucleotides and may be double or single stranded They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA, and vectors that express sinA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and used for treating cancer, restencesis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, ADDS, macular degeneration, skin ulcers and rheumatoid arthitis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, agenetic engineering, pharmacogenomics, studying gene function, and sequence mapping (e.g., of single nucleotide polymorphisms). The present sequence mapping (e.g., of single nucleotide polymorphisms). The present sequence

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA conterference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or charmacontain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically problems).
                                                                                                                                                         Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short harpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 3; SEQ ID NO 288; 145pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an attisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised. Expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue used to modulate expression of the telomerase genes in cells, tissue transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically
                                                                                      ö

ö
protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, ALDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene rapping e.g., of single nucleoride polyancphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflemmatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering nucleic acid; siNA; short interfering nucleic acid; siNA; micro-RNA; minNA; short interfering siRNA; attended RNA; micro-RNA; minNA; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short

interfering RNA (BiRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (BhRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in calls, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenoisis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lubus arythematosus AIDS, macular degeneration, eigen the understand rheumatoid arthritis. The siNAs are also useful for drug screnning, diagnosis, therapeutic target identification and validation, generated engapsing (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNN; micro-RNA; miRNA; short hairpin RNA; siRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

New short interfering nucleic acid downregulates expression of the

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA comprise reference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense of oligonucleotide. Specifically, the siNAs include and antisense contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be enemically synthesised. Components of solver the invitro or in vivo delivery of siNA; conjugates can contain deoxyribonucleotides, and can be enemically synthesised. The invention also can contain deoxyribonucleotides, and can be chemically synthesised. Complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treatment calcetion, or autoimmune or age-related diseases. Confections diseases (specifically processed in ulciple sclerosis, lupue erythematosus, AIDS, macular degeneration, sind genes compliants diagnosis, therapeutic rarget famentian and validation. Skin ulcers and rheumatoid arthritis. The sinNas are also useful for drug capteric engineering, pharmacogenomics, studying gene function, and gene captessents the upper strand of a human TERC-targeted double-stranded cusples sclerosis.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA committees and antisense interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically proteozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lugus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug correpting, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene corpusation the upper strand of a human TERC-targeted double-stranded creptered to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering uncleic acid; siNA; short interfering RNA; siRRA; double-stranded RNA; micro-RNA; miRNA; short interfering RNA; siRRA; double-stranded RNA; micro-RNA; miRNA; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

the inversious trainers to smort interioring nucercy dense by RNA interference. The sinks may or may not comprise sense and antisense conductor. The single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense conductoring the Specifically, the sinks include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically synthesised, can complexes of sink, and vector or invivo delivery of sink, conjugates and/or complexes of sink, by ex vivo genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be corpused for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, ce.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The sinks are also useful for drug screening, diagnosis, therapeutic target identification and validation, capanesing (e.g., of single mucleotide polymorphisms). The present sequence capanes, which is identical to the c-foe transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to short interfering nucleic acids (siNA) which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human TERC transcript target sequence/siNA upper strand, SEQ ID 28.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

Human TERC transcript target sequence/siNA upper strand, SEQ ID 30

26-FEB-2004 (first entry)

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense of ligonucleotide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNAs can be unmodified or chemically synthesised. Can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. Cexpressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cexplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protected in ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeuth crayer identification and validation, shin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeuth crayer identification and validation, sereening, diagnosis, therapeuth expecting servents the upper strand of a human TERC-targeted double-stranded crepresents the upper strand of a transcript target sequence.
RNA interference; short interfering nucleic acid; siNA; short interfering RNA; double-stranded RNA; micro-RNA; miRNA; short interfering RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 19 BP; 1 A; 9 C; 7 G; 0 T; 2 U; 0 Other;

New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise stonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue used to complexe of siNA; and vectors that express siNA. The siNAs are used to complexe of siNA; and vectors that express siNA. The siNAs are used to complexe of siNA; and vectors that express siNA. The siNAs are used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus expthematosus, ANDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug creening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence is read of a human TERC-targeted double-stranded contains and the upper strand of a human TERC-targeted double-stranded contains the presents that the upper strand of a human TERC-targeted double-stranded contains and the upper strand of a human TERC-targeted double-stranded double-stranded degeneration and sequence in the upper strand of a human transfer and restranded deserves the superior of the tearther of the superior of the stranded deserves the superior of the superi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 3; SEQ ID NO 30; 145pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised.

Expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue used to modulate expression of the telomerase genes in cells, tissue transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically corrocal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The sinAs are also useful for drug

The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antiennse regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised,
                          genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               vasotropic; protozoacide; immunosuppressive; dermatological;

expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of sinh, conjugates and/or complexes of sinh, and vectors that express sinh. The sinhs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenced, infectious diseases (specifically protozcal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNhs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nuclectide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short historing RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

Example 3; SEQ ID NO 278; 145pp; English.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an interfering RNA (siNAA), double-stranded RNA, micro-RNA (miRNA) and short niterfering RNA (siNAA). Adouble-stranded RNA, micro-RNA (miRNA) and short niterfering RNA (siNAA). The siNAS can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically sorthesised, cancomplexes of siNA, and vectors that express siNA. The siNAS are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                             used for treating cancer, restenosis, infectious diseases (apportifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological;

                                                                                                                                                                                      The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNAs can be unmodified or chemically synthesised, can contain deoxyribonucleotides, and can be elemically synthesised. Can contain deoxyribonucleotides, and can be elemically synthesised. Can contain deoxyribonucleotides, and can be elemically synthesised. Can expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA; and vectors that express sinA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and cransplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases. Ce g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug cremening, diagnosis, therapeutic target identification and validation, skin ulcers and rheumatoid expensiventy sinks are also useful for drug creptesents the upper strand of a human TERC-targeted double-stranded ceptored polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded construction, and gene companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The inversion transfer to such the one or more telomerase genes by NRA interference. The siNAs may or may not comprise sense and antisense be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siNRA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Correlates to kits for the in vitro or in vivo delivery of siNR, conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be concerned to the treatment of a variety of conditions. They may be corrected in the treatment of a variety of conditions. They may be corrected or multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, disagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene constraints the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ·,

Human TERC transcript target sequence/siNA upper strand, SEQ ID 25

(first entry)

26-FEB-2004

```
The invention relates to short interfering nucleic acids (siNA) which downrequiate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in calls, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and trensplants for the treatment of a variety of conditions. They may be used for treating cancer, restenoisis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lubus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthitis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, agenetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence
drug screening; diagnosis; therapeutic target identification;
pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                            New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            4.2%; Score 19; DB 1; Length 19; 100.0%; Pred. New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.

Example 3; SEQ ID NO 25; 145pp; English.

```
The invention relates to short interfering muclaicate actus (shink) which convergulate expression of the one or more telomerase genes by RNA interference. The sinks may or may not comprise ribonucleotides and maisense be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinks include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (mRNA) and short hairpin RNA (siRNA). The sinks can be unmodified or chemically withheaised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue captures or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplant rejection, or autoimmune or age-related diseases, protozoal), transplant rejection, or autoimmune or age-related diseases, protozoal), transplant rejection, or autoimmune or age-related diseases, comultiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumacoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, barmacogenomics, studying gene function, and genetic engenetation and genetic engenetation and genetic engenetation in the upper strand of a human TERC-targeted double-stranded diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
invention relates to short interfering nucleic acids (siNA) which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates confaint expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and candor complants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rhemamatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, centured mapping (e.g., of single nucleotide polymorphisms). The present sequence

ö
used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenced in infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siMAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; abhort hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA

interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short an antisense oligonucleotide. Specifically, the siNAs include short hard siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. Confirm a vector or enzymatically synthesised. The invention also capteses of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cand/or complexes of siNA; and vectors that express siNA. The siNAs are used to reganisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically proposed for conditions and rheumatoid arthritis. The siNAs are also useful for drug skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug cancer, cancer and signification and sense since the contains, diagnosis, therappeutic farget identification and validation, containing, diagnosis, therappeut captend for sense function and sense function and sense function.

                                                                                                                                                                                                                                                                                                                                                                                                                    genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human Tebreserts double-stranded siNs, which is identical to the c-fos transcript target sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ð
                                                                                                                          The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA characterence. The siNAs may or may not comprise ribonuclecides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA, and vectors that express sinc. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restencisis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus. AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, agenematic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; aiRNA; double-stranded RNA; micro-RNA; miRNA; short haipin RNA; shrNA; expression medulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNas may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNas include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNas can be unmodified or chemically modified, can contain decoxribbonucleotides, and can be chemically synthesised, can contain decoxribbonucleotides, and can be chemically synthesised, can contain decoxribbonucleotides, and can be chemically synthesised, can contain decoxribbonucleotides, and vectors that express sink. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be cotozeal), transplant rejection, or autoimmune or age-related diseases, cells multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening diagnosis, therapeutic target identification and validation, can mapping (e.g., of single mucleotide polymorphisms). The present sequence mapping (e.g., of single mucleotide polymorphisms). The present sequence constants the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hit strands acid; sinA; double-stranded sub, gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in calls, tissue explants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically cortozoal), transplant rejection, or autoimmune or age-related diseases, es multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TBRC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gapa

Sucrement. Also included are plantmaceutical compositions of gene drugs councilled. As becaused are plantmaceutical compositions of gene drugs of such as Dermogene, Lungene, Hepatogene, Leukogene, Lymphogene, Prostogene, Breastogene, Braintumogene and Skin-whitogene including but composed to the part or all of the following components: single or a group of specific 19-25 at daRNA, 19-25 at daRNA and/or bingle-stranded RNA and/or DNA with the special pattern, 5'-CGGAT(U)-3' or its derivatives, one or more nucleic acid condensation agents (or none), one or more pharmaceutical carriers, one or more pattern active agents and additional specific cell-targeting proteins and other active agents and additional materials) and a simplified method for predicting and selecting as specific and efficacious small double-stranded oligonucleotides (SDSO), antisense oligonucleotide molecules or short interfering RNA (sIRNA) (comprising identifying a special pattern that can be localised in any position of an oligonucleotide sequence valuating the specificity of a selected sequence). The Short interfering RNA (sIRNA) are targeted against genes involved in viral infection, malignant tumours, genetic and short double-stranded oligonucleotides as a gene drug that can specifically inactivate a group of corresponding genes. The composition can's be used for treating diseases or disorders associated with abnormal expression of genes in cells or tissues of humans or animals, such as viral infections, cancer, or genetic or metabolic diseases. The present conversed or sequence is a target region for an SDSO from an human cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to screening, identifying or predicting, and assembling 19-25 nt double-stranded oligonucleotides (termed short double stranded oligonucleotides, SDSO) as active pharmaceutical compositions for the treatment of viral infections, malignant tumours, and genetic and metabolic diseases, comprising screening and identifying a specific and protein chip microarrays. The above method comprises screening the cisease-causing genes, over-expressing in cells and/or tissues, with the disease-causing genes, over-expressing in cells and/or tissues, with the gene chip and protein chip microarrays, identifying a specific DNA generic within the abnormal gene encoding a protein or playing other biological roles with the assistance of computer and specific software, predicting efficacious 19-25 nt double-stranded oligonucleotides with a 5'-AU(T)CCG-3' or 5'-U(T)CCG-3' special pattern complementary to at least a portion of an RNA molecule and making sure that selected sequence is not localised within the stem-loop of target mRNA with any related control of the pharmaceutical compositions of gene drugs of the pharmaceutical compositions of gene drugs
Designing and selecting short double-stranded oligonucleotides for treating viral infections, cancer and genetic or metabolic diseases, comprises using gene chip and protein chip microarrays to identify

RESULT 226 AD022919 antisense Oligonucleotide molecules or short interfering RNA (siRNA) (comprising identifying a special pattern that can be localised in any position of an oligonucleotide sequence evaluating the specificity of a selected sequence). The Short interfering RNA (siRNA) are targeted against genes involved in viral infection, malignant tumours, genetic an metabolic diseases. The methods are useful for designing and selecting short double-stranded oligonucleotides as a gene drug that can specifically inactivate a group of corresponding genes. The composition may be used for treating diseases or disorders associated with abnormal expression of genes in cells or tissues of humans or animals, such as viral infections, cancer, or genetic or metabolic diseases. The present sequence is a target region for an SDSO from an human cDNA.

specific and efficacious small double-stranded oligonucleotides (SDSO),

```
The invention relates to screening, identifying or predicting, and assembling 19-25 nt double-stranded oligonucleotides (termed short double stranded oligonucleotides, SDSO) as active pharmaceutical compositions for the treatment of viral infections, malignant tumours, and genetic and metabolic diseases, comprising screening and identifying a specific DNA sequence in an abnormal gene encoding a protein with gene chip and protein chip microarrays. The above method comprises screening the disease-causing genes, over-expressing in cells and/or tissues, with the abnormal gene encoding a protein or playing other compression of protein chip microarrays, identifying a specific DNA composition of protein chip microarrays, identifying a specific DNA composition of predicting efficacious 19-25 nt double-stranded oligonucleotides with a composition of predicting efficacious 19-25 nt double-stranded oligonucleotides with a composition of an RNA molecule and making sure that selected sequence is not localised within the stem-loop of target mRNA with any related software. Also included are pharmaceutical compositions of gene drugs (such as Dermogene, Dungene, Hepatogene, Leukogene, Lymphogene, Composition of specific 19-25 nt daRNA, 19-25 nt sRNA-cDNA, 19-25 nt daRNA and/or single-stranded RNA and/or NNA with the special pattern, 5-composition of specific oper more pharmaceutical carriers, one or more composition and additional agents (or none), one or more pharmaceutical carriers, one or more specific cell-targeting proteins and other active agents and additional materials) and a simplified method for predicting and selecting a

```
The invention relates to screening, identifying or predicting, and assembling 19-25 nt double-stranded oligonucleotides (termed short double stranded oligonucleotides, SDSO) as active pharmaceutical compositions for the treatment of viral infections, malignant tumours, and genetic and metabolic diseases, comprising screening and identifying a specific BNA sequence in an abnormal gene encoding a protein with gene chip and protein chip microarrays. The above method comprises screening the disease-causing genes, over-expressing in cells and/or tissues, with the

```
The invention relates to screening, identifying or predicting, and casembling 19-25 in double-stranded oligomucleotides (termed short double stranded oligomucleotides) assembling 19-25 in double-stranded oligomucleotides (termed short double for the treatment of viral infections, malignant tumours, and genetic and for the treatment of viral infections, malignant tumours, and genetic and control and apportant gene encoding a protein with gene chip and protein chip microarrays. The above method comprises screening the protein chip microarrays. The above method comprises screening the protein chip microarrays. The above method comprises screening the protein chip microarrays. The above method comprises screening the protein chip microarrays in cells and/or tissues, with the case and protein chip microarrays, identifying a specific DNA sequence within the abormal gene encoding a protein or protein chip microarrays. Include a specific base causing genes over-expession in cells and/or there is continued to a nRAA molecule and making sure that selected sequence of predicting efficacious 19-25 nt double-stranded oligonucleotides with a signal and protein of an RNA molecule and making sure that selected sequence of some to localised within the stem-loop of target manks with any related conference. Indeed are pharmaceutical compositions of gene drugs software. Also included are pharmaceutical compositions of gene limited to part or all of the following components: single or protein and or indeed the mand/or DNA with the special pattern, 5.

Cromyrials) and efficacious small double-stranded oligonucleotides (SDSO), and estimate and elimited to parameter manded composition of an oligonucleotide molecules or short interfering RNA (siRNA) are cargeted sequence. The methods are useful for designing and selecting manded oligonucleotide molecules or short interfering the segment of an oligonucleotide sequence evaluating the specific and efficacious small device as a gene drug that can be composition of an oligonucleotide molecu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                            Designing and selecting short double-stranded oligonucleotides for treating viral infections, cancer and genetic or metabolic diseases, comprises using gene chip and protein chip microarrays to identify specific DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence is a target region for an SDSO from an human cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB 1; Length 19;

This invention relates to a novel method concerning prognostic markers associated with EGFR (epidermal growth factor receptor) positive cancer. Specifically, it refers to a gene expression profiling method that can provide a prediction as to whether a patient is likely to respond well to treatment with an EGFR inhibitor. The present invention describes the creatment with an EGFR inhibitor. The present invention describes the creatment with an EGFR inhibitor. The present invention describes the contractive analysis of the expression level of the RNA transcript of at CRP17, LAMC2 or their products thereof. It further provides a cDNA microarray containing named genes that represent prognostic transcripts which are useful for determining whether a patient diagnosed with an EGFR cappessing head or neck cancer or colon cancer exhibits elevated or decreased expression levels of these genes compared to normal. As such, these methods are also useful for prognosing or predicting the likelihood or cancer-attributable death or prognession, including recurrence and metastatic spread of a neoplastic disease, as well as drug resistance.

This oligonucleotide sequence is a PCR primer used to amplify a human PCR amplication of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Prognosing a patient with EGFR-expressing colon cancer comprises subjecting a sample comprising EGFR-expressing cancer cells to quantitative analysis of the expression level of the RNA transcript of at
                                                                                                                                                                                                                                              PCR primer to amplify a human cancer prognostic marker DNA SeqID 343.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to screening, identifying or predicting, and assembling 19-25 at double-stranded oligonucleotides (termed short double stranded oligonucleotides, SDSO) as active pharmaceutical compositions cranded oligonucleotides, SDSO) as active pharmaceutical compositions for the treatment of viral infections, malignant tumours, and genetic and metabolic diseases, comprising screening and identifying a specific DNA sequence in an abnormal gene encoding a protein with gene chip and croarrays. The above method comprises screening the disease-causing genes, over-expressing in cells and/or tissues, with the composition of the part of the protein of plant protein chip microarrays. The above method comprises screening the disease-causing genes, over-expressing in cells and/or tissues, with the assistance of computer and specific DNA sequence within the assistance of computer and specific DNA composition of an RNA molectule and making sure that selected sequence is not localised within the stem-loop of target mRNA with any related software, long or 5-u(I)(TCCG-3' sepecial pattern complementary to at software. Also included are pharmaceutical compositions of general collections are pharmaceutical compositions of general collections. Braintungene and Skin-whitegene included are pharmaceutical compositions of general pattern for specific 19-25 in daRNA, 19-25 in sRNA-cDNA, 19-25 in daRNA and or more pharmaceutical carriers, one or more pecific call-targeting proteins and other active agents and additional capacing or not and a simplified method for pracial pattern that can be localised in any pecific and efficacious small double-stranded oligonucleotide sequence evaluating the specific and efficacious small double-stranded oligonucleotide sequence evaluating the specific and efficacious small addition, malignant tumours, general pattern that can be localided and sele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expression of genes in cells or tissues of humans or animals, such as viral infections, cancer, or genetic or metabolic diseases. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel method concerning prognostic markers associated with EGFR (epidermal growth factor receptor) positive cancer. Specifically, it refers to a gene expression profiling method that can provide a prediction as to whether a patient is likely to respond well to treatment with an EGFR inhibitor. The present invention describes the quantitative analysis of the expression level of the RNA transcript of least one gene selected from the group of CD44v6, DBS, GROl, KRT17, LAMC2 or their products thereof. It further provides a cDNA microarray containing named genes that represent prognostic transcripts which are useful for determining whether a patient diagnosed with an EGFR expressing head or neck cancer or colon cancer exhibits elevated or decreased expression levels of these genes compared to normal. As such, these methods are also useful for prognessing or predicting the likelihood of cancer attributable death or progression, including recurrence and metastatic spread of a neoplastic disease, as well as drug resistance. This oligonucleotide sequence is a PCR primer used to amplify a human PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Prognosing a patient with EGFR-expressing colon cancer comprises subjecting a sample comprising EGFR-expressing cancer cells to quantitative analysis of the expression level of the RNA transcript of at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          amplicon DNA sequence used as a prognostic cancer marker, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                               PCR primer to amplify a human cancer prognostic marker DNA SeqID 344.

                                   The present invention relates to novel 2',5'-oligoadenylic acid analogs and their pharmacologically- acceptable salts. The analogs are stable with superior antitumour and antiviral activity and so are useful in cancer or antiviral therapy e.g. as antisense drugs. The present sequence was used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel 2',5'-oligoadenylic acid analogs and their pharmacologically- acceptable salts. The analogs are stable with superior antitumour and antiviral activity and so are useful in cancer or antiviral therapy e.g. as antisense drugs. The present sequence was used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel 2',5'-oligoadenylic acid analogs and their pharmacologically- acceptable salts. The analogs are stable with superior antitumour and antiviral activity and so are useful in cancer or antiviral therapy e.g. as antisense drugs. The present sequence was used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                         The present invention relates to novel 2',5'-oligoadenylic acid analogs and their pharmacologically- acceptable salts. The analogs are stable with supervior antitumour and antiviral activity and so are useful in cancer or antiviral therapy e.g. as antisense drugs. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; telomerase; hTR; activator-antisense complex; malignant; enzyme; cleave; brain; tumour malignant glioma; breast tumour; renal cell cancer; melanoma; prostate cancer; leukemia; polycthemia vera; myeloma; sarcoma; Hodgkin; slymphoma; Maldenstrom s macroglobulinemia; heavy chain disease; carcinoma; chemotherapeutic; antisense; ss.

This represents an antisense oligonuclectide to the RNA component of human telomerase (hTR) comprised in the. The invention relates to an activator-antisense complex that comprises: (a) an antisense oligo, complementary to a 12-25 nuclectide portion of the RNA component of hTR, with a hydroxyl moiety at the first end; and (b) a linker attached to the linker attached to the cirst end, and (c) an activator of RNase L attached to the linker. The activator-antisense complex may be used for inhibiting the growth of a telomerase-expressing malignant cell or tumour. The complex is used to specifically cleave the ribonuclectide portion of a telomerase enzyme. The complex inhibits growth of telomerase expressing malignant cells from real norm, and prostate cancer. Many other malignancies and related disorders, may be treated including various acute and chronic leukemias, polycthemia vera, Hodgkin's and non-Hodgkin's lymphomas, multiple myelome, including numerous sarcomas and carcinomas. The complex is preferably administered in combination with a chemotherapeutic agent, complexin, actinomycin D, or necestinostetin. The present sequence is an example of a modified antisense oligo comprised in an activator-antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; telomerase; hTR; activator-antisense complex; malignant; enzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New RNase L activator-telomerase antisense complex - useful to inhibit telomerase activity in telomerase-expressing malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

this represents an antisense oligonucleotide to the RNA component of human telomerase (hTR) comprised in the. The invention relates to an activator-antisense complex that comprises: (a) an antisense oligo, activator-antisense complex that comprises: (a) an antisense oligo, with a hydroxyl moiety at the first end; and (b) a linker attached to the linker attached to the linker attached to the linker. The activator-antisense complex may be used for inhibiting the growth of a telomerase expressing malignant cell or tumour. The complex is used to specifically cleave the ribonucleotide portion of a telomerase enzyme. The complex inhibits growth of telomerase expressing malignant glioma, breast tumour, renal cell cancer. The complex inhibits growth of telomerase expressing malignant glioma, breast tumour, renal cell cancer. The complex inhibits drown to telomerase expressing malignant glioma, breast tumour, renal cell cancer. Collicating various acute and chronic leukemias, polycthemia vera, Hodgkin's and non-Hodgkin's lymphomas, multiple tumours, including numerous sarcomas and carcinomas. The complex is preferably administered in combination with a chemotherapeutic agent, bleomychin, actinomycin D, or neocarzinostatin. The present sequence is an example of a modified antisense oligo comprised in an activator-antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 6 A; 5 C; 8 G; 1 T; 0 U; 0 Other;

The present sequence is that of a short interfering RNA, denoted hTR#2 siRNA, a 19 bp sequence centred in the 26 bp loop in the longest single-stranded region of human telemerase RNA. The siRNA comprises sense and antisense nucleic acids that are complementary to each other except for 2 thymidine deoxynucleotides at both 3' overhangs. A nucleic acid comprising the double-stranded region of this siRNA is specifically claimed. The invention relates to the discovery that double-stranded interfering RNAs which target telomerase RNA, or mRNA encoding telomerase interfering RNAs which target telomerase RNA, or mRNA encoding telomerase activity. Inhibition of telomerase in cancer cells leads to telomerase activity end-to-end chromosomal fusion, and apoptosis. Interference of shortening, end-to-end chromosomal fusion, and apoptosis. Interference of contraception or sterilisation, for immunosuppression, for treatment of contraception or sterilisation, for immunosuppression, for treatment of yeast, parasite and fungal infections, and in antiinflammatory therapies. As telomerase is active in a limited number of cell types, e.g. tumour cells, germaine cells, certain stem cells of the haematopoietic system, T and B cells, sun-damaged skih, and proliferative cervix, most normal cells are not affected by telomerase RNA interference therapy
                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= a //tabel= Sticky end //tabel= Sticky end //tabel= "the 3' end of the complementary strand overhangs the s' end of this strand by the sequence 5'-IT-3'"

The siRNA comprises sense and antisense nucleic acids that are complementary to each other except for 2 thymidine deoxynucleotides at both 3' overhangs. A nucleic acid comprising the duble-stranded region of this siRNA is specifically claimed. The invention relates to the discovery that double-stranded interfering RNAs which target telomerase RNA, or mRNA encoding telomerase reverse

ö
transcriptase (TERT), are capable of inhibiting telomerase activity. Inhibition of telomerase in cancer cells leads to telomera shortening, end-to-end chromosomal fusion, and apoptosis. Interference of telomerase activity can also be used for treatment of infertility, for contraception or sterilastion, for immunosuppression, for treatment of of yeast, parasite and fungal infections, and in antiinflammatory therapies. As telomerase is active in a limited number of cell types, e.g. tumour cells, germline cells, certain stem cells of the hematopojoitic system, T and B cells, sun-damaged skin, and proliferative cervix, most normal cells are not affected by telomerase RNA interference therapy

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and matisense regions, or alternatively are assembled from a sense oligonuclectide and an interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates candor complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and cranded the confictions of the telomerase genes in cells, tissue companisms (e.g., by ex vivo gene therapy), or in grafts and confictions of the treatment of a variety of conditions. They may be conditions or organisms (e.g., by expense).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Ribothymidines. Also, the internucleotide linkage is phosphorothioate"
                                                                                                                                                                                                                                                                                                                                                                                                                                       used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siMs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nuclectide polymorphisms). The present sequence represents a chemically modified siRNA targeted to the human TERC mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; meuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering NNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; siRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           'note= "Pyrimidine bases are 2'-deoxy-2'-fluoro"
